

LIST OF RESISTANCE - II anaerobic adhesives

On the following pages, we give an overview of the resistance of the cured adhesives against different media. This overview refers to chemicals of all kind and gases commonly used in the industry sector.

The list of resistance is based on years of practical experience, on laboratory experiments and on the behaviour of similar plastics. The list should just give a hint, if the probability of resistance is given. Self tests by the end-consumer can not be replaced by the list, due to the different operating conditions.

The list refers to anaerobic adhesives as follows:
